# Design Using Pseudocode

## server.js

If (node environment is NOT equal to production):

    Require('dotenv').config()

Initialize constant variable express to require('express')

Initialize constant variable ejs to require('ejs')

Initialize constant variable mongoose to require('mongoose')

Initialize constant variable app to express()

Call set function on app variable, passing in arguments ('view engine', 'ejs')

Call use function on app variable, passing in argument (express.urlencoded({extended: true}))

Call use function on app variable, passing in argument (express.static('public'))

Call mongoose.connect function, with arguments (DATABASE\_URL env variable, {  
    useNewUrlParser set to true  
    useUnifiedTopology set to true  
})

Initialize constant variable db to mongoose.connection

Call db.on function, passing in arguments ('error', (err) => output error to console)

Call db.once function, passing in arguments ('open', () => output successful database connection message to console)

Initialize constant variable indexRouter to require('./routes/index')

Call use function on app variable, passing in arguments ('/', indexRouter)

Call listen function on app variable, passing in arguments (PORT environment variable OR 3000, () => output to console that server has started)

## index.js

Initialize constant variable express to require('express')

Initialize constant variable router to express.Router()

Initialize constant variable Customization to require('../models/customization')

Initialize constant variable fetch to require('node-fetch')

Initialize constant variable TikTokScraper to require('tiktok-scraper')

Initialize constant variable randomWords to require('random-words')

GET router with '/' as URL path and the following asynchronous callback function, which has parameters (req, res):

    Try:

        Initialize variable searchQuery to req.query.q

        Initialize constant variable apiKey to API\_KEY environment variable

        Declare variables returnedYoutubeData, parsedYoutubeData, and stringYoutubeData

        Declare variables returnedRedditData, parsedRedditData, and stringRedditData

        Declare variables parsedTiktokData, stringTiktokData

        Initialize variable settings to awaited document from customizations collection

    If (no document found):

        Set settings to a new document based on Customization model

        Await settings.save()

Initialize constant variable maxResults to settings.maxPostsPerPlatform

If (searchQuery):

    If (searchQuery is equal to "")

        Set searchQuery to a random word by calling randomWords function

    If (item at index 0 of settings.selectedPlatforms array is equal to true):

        If (searchQuery is equal to "\$"):

            Set returnedYoutubeData to awaited return value of calling the YouTube Data API for most popular videos

        Else:

            Set returnedYoutubeData to awaited return value of calling the YouTube Data API for videos matching query

        Set parsedYoutubeData to awaited parsed version of returnedYoutubeData

        Set stringYoutubeData to stringified version of parsedYoutubeData

        Output parsedYoutubeData to console

    If (item at index 1 of settings.selectedPlatforms array is equal to true):

        If (searchQuery is equal to "\$"):

            Set returnedRedditData to awaited return value of calling the Reddit API for most popular posts

        Else:

            Set returnedRedditData to awaited return value of calling the Reddit API for posts matching query

        Set parsedRedditData to awaited parsed version of returnedRedditData

        Set stringRedditData to stringified version of parsedRedditData

        Output parsedRedditData to console

    If (item at index 2 of settings.selectedPlatforms array is equal to true):

        If (searchQuery is equal to "\$"):

            Set searchQuery to 'trending'

        Set parsedTiktokData to await TikTokScraper.user(searchQuery, {

            Set number to maxResults

            Set sessionList to ['sid\_tt=58ba9e34431774703d3c34e60d584475;']

        })

        Set stringTiktokData to stringified version of parsedTiktokData

        Output parsedTiktokData to console

Res.render index page, with context object including: searchQuery, stringYoutubeData, stringRedditData, stringTiktokData, settings

Catch (err):

    Output err to console

POST router with '/' as URL path and the following asynchronous callback function, which has parameters (req, res):

    Initialize constant variable searchQuery to req.body.searchQuery

    Initialize constant variable settings to awaited document from customizations collection

    Initialize constant variable youtubeCheckbox to true if req.body.youtubeCheckbox equals 'on' and false otherwise

    Initialize constant variable redditCheckbox to true if req.body.redditCheckbox equals 'on' and false otherwise

    Initialize constant variable tiktokCheckbox to true if req.body.tiktokCheckbox equals 'on' and false otherwise

    Set settings.selectedPlatforms to [youtubeCheckbox, redditCheckbox, tiktokCheckbox]

    Set settings.maxPostsPerPlatform to req.body.maxPostsPerPlatform

    Await settings.save()

    If (searchQuery):

        Res.redirect to '/' route with query string appended that denotes the search query

Else:

Res.redirect to '/' route

Set module.exports to router

## Testing/Verification

### Test Case 1: Mobile responsiveness

This test case involved using the Element Inspector to resize the application window. As expected, after a certain breakpoint, the hero illustration fell beneath the bold white text, ensuring that the elements would appear organized on a mobile display. All other sections continued to appear readable and structured when the window size was decreased, ensuring that the Mosaic application is fully mobile responsive.

### Test Case 2: Form validation

This test case involved leaving the search bar blank and attempting to submit the form. As expected, a warning message was displayed, informing the user to fill out the field in order to proceed. This proves that Mosaic's form validation is working as intended.

### Test Case 3: Data persistence

This test case involved changing the social media filtering options as well as the max posts per platform and submitting sample search queries. As expected, when the page was refreshed, the options remained changed, indicating that the user's settings are being persisted. Additionally, the Mosaic page was exited and reopened; as expected, the re-opened page persisted the user's custom settings.

### Test Case 4: No social media platforms selected

This test case involved unchecking all of the social media platforms and submitting sample search queries. As expected, the following message was displayed in the results section: "Select one or more social media

platforms to see results.” This confirms the intended functionality, as no posts should be returned if there are no social media platforms to pull from.

### **Test Case 5: Indicating search queries**

This test case involved submitting sample search queries and paying attention to both the URL and the header of the results section. As expected, when valid search queries were submitted, such as “dog” or “cat”, the query string in the URL reflected this, and the results section displayed the following header: “Results for x”, where x represents the search query in quotation marks. Deliberate exceptions to this rule include when the special commands are entered as search queries—namely, \* and \$. When \* was entered, the query string reflected the \* symbol while the results header showed the random keyword generated; when \$ was entered, the query string reflected the \$ symbol while the results header read “Trending results.” All of this behaviour is to be expected, so Mosaic is indicating search queries appropriately.

### **Test Case 6: Settings–content consistency**

This test case involved trying out various combinations of settings and submitting sample search queries to see if the displayed results would be tailored accordingly. For example, would ticking only YouTube result in only YouTube content being displayed? What about ticking only Reddit and TikTok? If I changed the max results per platform to 1, would I only get 1 result per selected platform? As expected, the results were always filtered in alignment with the settings.

### **Test Case 7: Special commands**

This test case involved entering the special commands as search queries. As expected, when \* was entered, a randomly-generated word became the new search query; when \$ was entered, the results header showed “Trending results” and trending results were indeed displayed.

## **Test Case 8: Embed interactivity**

This test case involved clicking on the social media posts after they were loaded in to ensure that a user could play the content. As expected, the embeds responded to user action, and videos would play when clicked.

## **Test Case 9: Console data**

This test case involved submitting sample search queries and observing the activity in the console. As expected, when search queries were submitted, objects containing the parsed API data were logged to the console, confirming the intended functionality.

## **Maintenance**

While it is too early to practice maintenance, as Mosaic has only just been deployed, strategies for maintenance can be discussed. One strategy for maintenance could be performing weekly tests and code reviews as opposed to simply deploying the application and forgetting all about it! This way, bugs in the code can not only be addressed but addressed quickly, ensuring a well-maintained program. Furthermore, all updates and modifications to the codebase can be committed to the remote GitHub repository. This way, there is a record of changes that can be referred to in times of confusion; equally important, old commits can be reverted to in case any updates backfire.

Maintenance would be pretty boring if it only meant fixing bugs and keeping the status quo—it may also entail new and exciting features! Some features that may be implemented in future iterations of Mosaic include:

- More social media platforms, such as Instagram and Twitter
- AJAX for a more dynamic user experience
- Incorporating individual user accounts
- Improving querying speed

Finally, when might it be time to retire the program? Arguably, there was no need for the program in the first place, so retirement due to lack of need might not be applicable. However, if the social media APIs permanently changed to prohibit certain content from being fetched, then that may render a program such as Mosaic infeasible. Furthermore, many free APIs have definite call limits, and so if Mosaic exhausts the call limits, then it may no longer be able to work. Finally, there is a legal concern of whether it is right for a developer to profit off of an application that steals content from other platforms. If the laws change, then so may the longevity of Mosaic.
